Temperature measurement in the oven is important - optical control is perfect!

For an extensive process analysis, many different parameters have to be captured, it's not enough to only record the temperature.

With the new Reflow Inline Camera HiCam, you also measure the temperature but additionally you detect vibrations and - much more important - you can monitor your process optically:

- The HiCam Inline Reflow Camera records the PCB during the passage through the oven.
- Watch the melting of the solder joints and the movement of the components during the process.
- Draw conclusions regarding the origin of possible mistakes, i.e. upcoming tombstoning.

Therefore; Win a competitive advantage with an improved process control!
